

System Architecture Diagram

This architecture shows how the user interacts with the frontend, which communicates with the Flask backend. The backend integrates the trained ML model and stores results in SQLite database.

Use Case Diagram – Student Interaction

This diagram represents the key functionalities available to the student such as entering data, predicting stress levels, viewing wellness recommendations, and checking prediction history.

Sequence Diagram – System Workflow

This sequence diagram explains step-by-step communication between frontend, Flask backend, ML model, and database during prediction and response generation.

High-Level System Overview

This overview shows the simple interaction between the user and the stress prediction system, highlighting the core system boundary.

Detailed Process Flow – ML Stress Prediction

This flow describes how user input is validated, processed by the ML model, used for stress prediction, and then converted into recommendations and stored.

Data Flow & Recommendation Pipeline

This pipeline illustrates how input data moves through processing, ML prediction engine, recommendation generation, and database storage before displaying results.
